Amendments to the Claims:

This listing of claims will replace all prior versions, and listings, of claims in the application:

Listing of the Claims:

1 Claim 1 (currently amended): A method of performing additive
2 synthesis of digital audio signals ~~in a recursive digital~~
3 ~~oscillator~~, comprising:

4 receiving digital audio signal frames in a digital
5 oscillator wherein each digital audio signal frame includes
6 a set of frequency, amplitude, and phase components
7 represented as coefficients of variables in a mathematical
8 expression, each digital audio signal frame thereby
9 including a frequency coefficient representation, wherein
10 said digital oscillator is a recursive digital oscillator
11 generating frequency f lying in the range from zero to one-
12 half of a sampling frequency f_s , including recursion
13 coefficients x_n given by $x_n = 2x_{n-1} - \epsilon x_{n-1} - x_{n-2}$, wherein $\epsilon =$
14 $2 - 2 \cos(\omega)$ and wherein $\omega = 2\pi f/f_s$, and

15 forming converted frequency coefficients by Re-Mapping
16 of bits of said frequency coefficient representation to bias
17 audio reproduction accuracy toward low frequency signals
18 ~~wherein said digital oscillator is an oscillator as in~~
19 ~~claim 16 A~~

20 ~~and~~ wherein said Re-Mapping biases the generating
21 frequency of said oscillator, whereby ϵ is represented by
22 an unsigned mantissa, m , combined with an unsigned
23 exponent, e , biased so that the actual represented value
24 is $\epsilon = 2^{2-e} m$,
25 ~~as in claim 17; and~~

26 performing additive synthesis with said converted
27 frequency coefficients, thereby synthesizing audio samples.

1 Claim 2 (previously presented): The method of claim 1
2 further comprising the step of defining said frequency
3 coefficient representation with an exponent characterizing a
4 floating-point range extension.

1 Claim 3 (previously presented): The method of claim 2
2 wherein said defining step includes the step of specifying
3 said exponent to correspond to a right shift amount
4 necessary to correct for precision limitations introduced by
5 limiting Re-Mapping coefficients to 16 bits.

1 Claim 4 (previously presented): The method of claim 3
2 wherein said receiving, forming, and performing steps are
3 implemented utilizing a 16-bit fixed point processor.

1 Claim 5 (previously presented): The method of claim 1
2 wherein said receiving, forming and performing steps are
3 implemented utilizing a digital signal processor.

1 Claim 6 (previously presented): The method of claim 1
2 wherein said receiving, forming, and performing steps are
3 implemented utilizing a field programmable gate array.

1 Claim 7 (previously presented): The method of claim 1
2 wherein said receiving, forming, and performing steps are
3 implemented utilizing a Very Long Instruction Word
4 processor.

1 Claim 8 (previously presented): The method of claim 1
2 wherein said receiving, forming, and performing steps are
3 implemented utilizing a Reduced Instruction Set Computer.

1 Claim 9 (previously presented): The method of claim 1
2 wherein said receiving, forming, and performing steps are
3 implemented utilizing a Residue Number System processor.

1 Claim 10 (currently amended): A computer readable ~~memory~~
2 medium encoded with computer executable instructions to
3 ~~direct a processor to function in a specified manner,~~
4 comprising:

5 a first set of executable instructions to receive
6 digital audio signal frames wherein each digital audio
7 signal frame has a set of specified frequency values
8 expressed as a bit sequence;

9 a second set of executable instructions to Re-Map said
10 bit sequence to represent lower frequencies with more
11 significant bits and higher frequencies with less
12 significant bits; and

13 a third set of executable instructions to facilitate
14 additive synthesis of said digital audio signal frames in a
15 reduced-precision recursive digital oscillator

16 ~~wherein said digital oscillator is an oscillator as in~~
17 claim 16, wherein said recursive digital oscillator
18 generates frequency f lying in the range from zero to one-
19 half of a sampling frequency f_s including recursion
20 coefficients x_n given by $x_n = 2x_{n-1} - \epsilon x_{n-1} - x_{n-2}$, wherein $\epsilon =$
21 $2 - 2 \cos(\omega)$ and wherein $\omega = 2\pi f/f_s$, and

22 and wherein said Re-Mapping biases the generating
23 frequency of said oscillator ~~as in claim 17~~, whereby ϵ is
24 represented by an unsigned mantissa, m , combined with an

25 unsigned exponent, e , biased so that the actual
26 represented value is $\varepsilon = 2^{2-e} m$.

1 Claim 11 (previously presented): The computer readable
2 memory of claim 10 wherein said first set of executable
3 instructions include instructions to identify a frequency
4 coefficient representation of said specified frequency.

1 Claim 12 (previously presented): The computer readable
2 memory of claim 11 further comprising a fourth set of
3 executable instructions to define said frequency coefficient
4 representation with an exponent characterizing a
5 floating-point range extension.

1 Claim 13 (previously presented): The computer readable
2 memory of claim 12 wherein said fourth set of executable
3 instructions include instructions to specify said exponent
4 to correspond to a right shift amount necessary to correct
5 for precision limitations introduced by a reduced precision
6 processor.

Claims 14-18 (canceled)
